Urban Cable Cars – a new dimension to sustainable urban mobility
Organized by Doppelmayr Seilbahnen, Austria

Background
The purpose of the event is to share our knowledge, experience and ideas of sustainable urban mobility and their implementation within the New Urban Agenda with a strong focus on urban cable cars. Examples of existing systems will be reviewed as a way to illustrate the numerous possibilities for alignments, stations, lengths and applications.

Relevance to the GC26 theme
Cable cars play an increasing role as urban transport infrastructure: as a practical add-on to complement car, bus and train services. They bridge natural obstacles such as rivers, cope easily with differences in altitude, link densely populated settlements, help to relieve routes with high volumes of traffic, and extend existing transport services.

Objective
The event is designed to educate, inform and inspire about the capabilities and possibilities of cable transit.
